

## Exercise sheet

Lecturer: Georgios P. Karagiannis

georgios.karagiannis@durham.ac.uk

### Part 1. Types of spatial data

**Exercise 1.** (★)(Columbus Columbus OH data set) Figure 2a shows the Property crime (number per thousand households) in 49 districts in Columbus in 1980, as well as the average value of the house in USD. Figure 2b presents the corresponding average house value. This is the R dataset `columbus{spdep}`. Interest may lie to find whether high rates of crime are clustered in a particular areas, and if yes, perhaps what is the association of it with the value of the houses in the area. To which principal spatial statistical are would you associate this problem?

FIGURE 1. Columbus Columbus OH spatial analysis dataset

**Exercise 2.** (★)(Columbus Columbus OH data set) Figure 2a shows the Property crime (number per thousand households) in 49 districts in Columbus in 1980, as well as the average value of the house in USD. Figure 2b presents the corresponding average house value. This is the R dataset `columbus{spdep}`. Interest may lie to find whether high rates of crime are clustered in a particular

areas, and if yes, perhaps what is the association of it with the value of the houses in the area. To which principal spatial statistical are would you associate this problem?

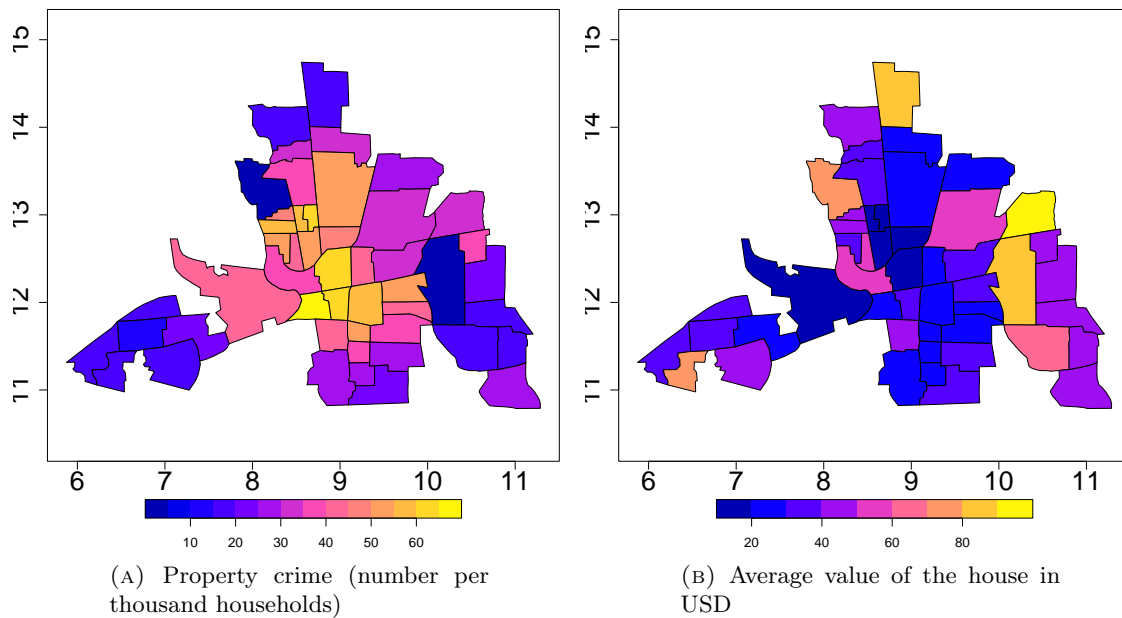

FIGURE 2. Columbus Columbus OH spatial analysis dataset

---

**Exercise 3.** (★)(Soil chemistry properties data set.) It contains measurements of various chemical properties of soil samples collected at different locations in a field. These properties include: the acidity or alkalinity of the soil (PH), the salt concentration in the soil (Salinity), and others. It is the R dataset `soil250{geoR}`. Figure 3 presents the locations these measurements are taken. The data (measurements) are in fixed locations at a regular grid of points. The domain scientist would be interested in the nutrient levels and pH to assess soil fertility and make recommendations for agricultural practices. The statistician could (i.) estimate/predict values of soil properties at unsampled locations based on measurements at sampled locations; and (ii.) assess the spatial variability of soil properties (nutrient levels and pH) to identify regions with high or low variability. To which principal spatial statistical are would you associate this problem?

FIGURE 3. Soil chemistry data set

---

**Exercise 4.** (★)(Scallop abundance data) Figure 4 presents 148 locations (degrees of longitude & latitude) in the Atlantic waters off the coasts of New Jersey and Long Island New York as coordinates and the size of scallop catch at the corresponding location as the dot size. The sites are at fixed locations within an irregular grid of points. Sustainable scallop abundance is critical for the long-term economic viability of the fishing industry. A healthy and stable scallop population supports a consistent source of income for fishermen and related businesses. To which principal spatial statistical are would you associate this problem?

FIGURE 4. Scallop abundance data

---

**Exercise 5.** (★)(Wolfcamp-aquifer data) Figure 5 presents locations and levels (in feet above sea level) of piezometric head for the aquifer; they are obtained by drilling a narrow pipe into the aquifer and letting the water find its own level in the pipe. After rigorous screening of unsuitable wells, 85 remained. There is interest to find where the radionuclide contamination would flow from the

site in Deaf Smith County, Texas. Beneath Deaf Smith County is a deep brine aquifer known as the Wolfcamp aquifer, a potential pathway for any radionuclides leaking from the repository. The predicted direction of flow can be used to determine locations of downgradient and upgradient wells for a groundwater monitoring system. A first direction in analyzing this spatial data set is to draw a map of a predicted surface based on the (irregularly located) 85 data. To which principal spatial statistical are would you associate this problem?

FIGURE 5. Wolfcamp-aquifer data. Piezometric-head levels (feet above sea level) vs coordinates.

**Exercise 6.** (★)(Swiss rainfall data) Figure 6 presents the locations of the 100 locations in Switzerland as dots whose size and color indicates the amount of the corresponding rainfall measurements (in 10th of mm) taken on May 8, 1986. This is the R data set `SIC{geoR}`. Observation sites are irregularly spaced, and fixed. A scientific objective may be to analyzing rainfall patterns with purpose to optimize crop planting and irrigation schedules. A statistician is able to estimate rainfall values at unsampled locations based on available measurements, create maps that represent the spatial distribution of rainfall, or quantify the uncertainty associated with rainfall estimates and predictions, which are important for risk assessment and decision-making. To which principal spatial statistical are would you associate this problem?

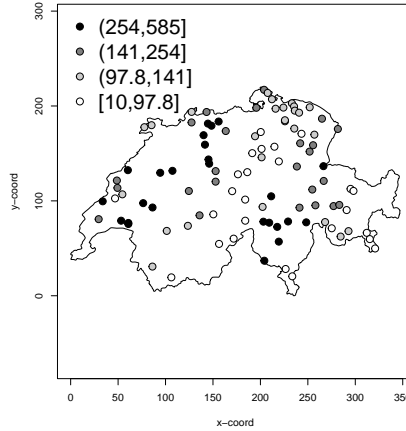

FIGURE 6. Swiss rainfall data

## Part 2. INLA

**Exercise 7.** (★) Consider the model

$$\begin{cases} z_i | \eta_i \sim \text{Poisson}(\exp(\eta_i)) & i = 1, \dots, n \\ \eta_i = \beta_0 + \beta_1 w_i + u_{j(i)} \\ u \sim N_m(0, I\tau^{-1}) \end{cases}$$

where  $\{w_i\}$  are covariates,  $j(i)$  is a known mapping from  $1 : n$  to  $1 : m$  (given below in the dataset as `idx`).

For training use the following data set  $\{(z_i, w_i)\}_{i=1}^n$  by running

```
rm(list=ls())
# generate the dataset
set.seed(123456L)
n = 50;
m = 10
w = rnorm(n, sd = 1/3)
u = rnorm(m, sd = 1/4)
intercept = 0;
beta = 1
idx = sample(1:m, n, replace = TRUE)
z = rpois(n, lambda = exp(intercept + beta * w + u[idx]))
table(z, dnn=NULL)
```

Do the following, by using R-INLA

- (1) Run `inla{INLA}` in order to train the above model, and generate an `inla` object (that you will call it `out.inla`). For the function `inla{INLA}` specify the formula, data, and family

arguments. To approximate the conditional pdf of latent variables of the GMRF use the Gaussian approximation. For the rest parameters just use the default R-INLA options.

- (2) Print a summary of the marginal posteriors
- (3) Produce and print the marginal posterior pdf of  $\Pr(\beta_1|z)$ .

### Part 3. Point referenced data / Geostatistics

**Exercise 8.** (★) If  $c : \mathbb{R}^d \rightarrow \mathbb{R}$  is the covariogram of a weakly stationary random field  $Z = (Z_s)_{s \in \mathbb{R}^d}$  then  $c(\cdot)$  is semi-positive definite; i.e. for all  $n \in \mathbb{N}$ ,  $a \in \mathbb{R}^n$ , and  $\{s_1, \dots, s_n\} \subseteq S$

$$\sum_{i=1}^n \sum_{j=1}^n a_i a_j c(s_i - s_j) \geq 0$$

**Exercise 9.** (★) Show that if  $c_1(\cdot, \cdot)$  and  $c_2(\cdot, \cdot)$  are covariance functions (are non-negative definite) then so are  $c_3(\cdot, \cdot) = bc_1(\cdot, \cdot) + dc_2(\cdot, \cdot)$  and  $c_4(\cdot, \cdot) = c_1(\cdot, \cdot) c_2(\cdot, \cdot)$ .

**Exercise 10.** (★) Consider the Gaussian c.f.  $c(h) = \sigma^2 \exp\left(-\beta \|h\|_2^2\right)$  for  $\sigma^2, \beta > 0$  and  $h \in \mathbb{R}^d$ . Compute the spectral density from Bochner's theorem

**Exercise 11.** (★) Consider the Exponential c.f.  $c(h) = \sigma^2 \exp\left(-\beta \|h\|_1\right)$  for  $\sigma^2, \beta > 0$  and  $h \in \mathbb{R}^d$ . Compute the spectral density from Bochner's theorem

(Given as Formative assessment 1)

**Exercise 12.** (★) Let  $Z = (Z_s)_{s \in \mathbb{R}^d}$  be an intrinsically stationary stochastic process, and let  $\gamma : \mathbb{R}^d \rightarrow \mathbb{R}$  be its semivariogram. Assume  $a \in \mathbb{R}^n$  s.t.  $\sum_{i=1}^n a_i = 0$ .

- (1) Let  $a \in \mathbb{R}^n$  be a vector of constants. Show that

$$\text{Var} \left( \sum_{i=1}^n a_i Z(s_i) \right) = \sum_{i=1}^n \sum_{j=1}^n a_i a_j c_Y(s_i, s_j)$$

where  $c_Y(s, t) = E(Y(s)Y(t))$ , and  $Y_s = Z_s - Z_0$ .

- (2) Show that

$$c_Y(s, t) = \gamma(s) + \gamma(t) - \gamma(s - t)$$

- (3) Show that for all  $\forall \{s_1, \dots, s_n\} \subseteq S$  it is

$$\sum_{i=1}^n \sum_{j=1}^n a_i a_j \gamma(s_i - s_j) \leq 0$$

(Given as Formative assessment 1)

**Exercise 13.** (★) Consider the zero-mean geostatistical process  $Z = (Z_s)_{s \in \mathbb{R}^d}$  with a weakly stationary and isotropic covariance function given by

$$c(h) = \begin{cases} \xi^2 (1 + \rho \|h\|) \exp(-\rho \|h\|), & h > 0 \\ \nu^2 + \xi^2, & h = 0 \end{cases}$$

- (1) Compute the semi-variogram for the geostatistical process  $(Z_s)$
- (2) What are the nugget, sill and partial sill for this covariance model? Justify your answer.
- (3) Would the slightly altered covariance function defined below be a good model for spatial data for  $\phi > 0$ ? Justify your answer.

$$c(h) = \begin{cases} \xi^2 (1 + \rho \|h\|) \exp(-\rho \|h\|) + \phi, & h > 0 \\ \nu^2 + \xi^2 + \phi, & h = 0 \end{cases}$$

---

**Exercise 14.** (★) Consider we the geostatistical model  $(Z_s)_{s \in \mathcal{S}}$  with

$$Z(s) = \mu(s) + w(s) + \varepsilon(s)$$

where  $\delta(s)$  is a weakly stationary process with mean zero and covariogram  $c_\delta(h; \sigma^2, \phi) = \sigma^2 \exp\left(-\frac{1}{\phi} \|h\|\right)$ ,  $\mu(s; \beta)$  is a deterministic function

$$\mu(s; \beta) = \sum_{j=0}^p \psi_j(s) \beta_j = (\psi(s))^\top \beta$$

with unknown coefficients  $\beta = (\beta_0, \dots, \beta_p)^\top$  and known basis functions  $\psi(s) = (\psi_0(s), \dots, \psi_p(s))^\top$ ,  $\varepsilon(s)$  is a nugget effect process whose covariogram has sill  $\tau^2$ , and assume that  $w(s)$  and  $\varepsilon(s)$  are independent.

- (1) Write down the covariogram  $c(h; (\sigma^2, \phi, \tau))$  of  $(Z_s)$ .
- (2) Consider a re-parametrization  $\theta = (\sigma^2, \phi, \xi)$  where  $\xi^2 = \frac{\tau^2}{\sigma^2}$  is called signal to noise ratio. Assume there is available a dataset  $\{(s_i, Z_i)\}_{i=1}^n$  where  $Z_i := Z(s_i)$  is a realization of  $(Z_s)_{s \in \mathcal{S}}$  at site  $s_i$ .
  - (a) Let  $\Psi$  be a matrix with  $[\Psi]_{i,j} = \psi_j(s_i)$ . Let  $D$  be a matrix such as  $[D]_{i,j} = \|s_i - s_j\|$ . Write down the covariance matrix  $C(\theta)$  of  $Z = (Z_1, \dots, Z_n)^\top$  as a function of  $D$  and  $\theta$ .  
**Hint::** You can use convenient notation such as  $\exp(D)$  meaning  $[\exp(D)]_{i,j} = \exp(D_{i,j})$ .
  - (b) Write down the log likelihood function  $\log(L(Z; \theta))$  of  $Z = (Z_1, \dots, Z_n)^\top$  given  $\theta = (\sigma^2, \phi, \xi)$ .
- (3) Let  $r(\cdot)$  (called correlogram) such as  $c(\cdot) = \sigma^2 r(\cdot)$ . For the following, assume that  $(\phi, \xi)$  as known constants.

- (a) Compute the likelihood equations<sup>1</sup> w.r.t.  $(\beta, \sigma^2)$ , and for given  $(\phi, \xi)$ .
- (b) Compute the MLE  $\hat{\beta}_{(\phi, \xi)}$  of  $\beta$  as a function of  $(\phi, \xi)$
- (c) Compute the MLE  $\hat{\sigma}_{(\phi, \xi)}^2$  of  $\sigma^2$  as a function of  $(\phi, \xi)$ .
- (d) Compute the unbiased estimator of  $\tilde{\sigma}^2$  of  $\sigma^2$ .

**Hint:** Consider the fitted values  $e = (e_1, \dots, e_n)^\top$  as  $e = [I - H] Z$  where  $H = (\Psi^\top R^{-1} \Psi)^{-1} \Psi^\top R^{-1}$ , and write  $\hat{\sigma}_{(\phi, \xi)}^2$  w.r.t.  $e$ .

**Hint:** It is given that  $E(Z^\top A Z) = E(Z)^\top A E(Z) + \text{tr}(A \text{Var}(Z))$  when  $Z \sim \text{Normal}$

- (4) Compute the so-called log “profiled likelihood”  $\log(L(Z; (\phi, \xi)))$  resulting as

$$L(Z; (\phi, \xi)) = L\left(Z; \beta = \hat{\beta}_{(\phi, \xi)}, \sigma^2 = \hat{\sigma}_{(\hat{\beta}_{(\phi, \xi)}, \phi, \xi)}^2, \phi, \xi\right)$$

by replacing the  $\beta$  with  $\hat{\beta}_{(\phi, \xi)}$  and  $\sigma^2$  with  $\hat{\sigma}_{(\hat{\beta}_{(\phi, \xi)}, \phi, \xi)}^2$  in the actual likelihood  $L(Z; \beta, \theta = (\sigma^2, \phi, \xi))$ .

Describe how you would compute suitable values for the MLE  $(\hat{\phi}, \hat{\xi})$  of  $(\phi, \xi)$

**Exercise 15. (★)** Let  $(Z_s)_{s \in \mathcal{S}}$  be a specified statistical model. Assume that  $(Z_s)_{s \in \mathcal{S}}$  is weakly stationary with unknown constant mean  $\mu = E(Z(s))$  and known covariogram  $c(\cdot)$ . Assume there is available a dataset  $\{(s_i, Z_i := Z(s_i))\}_{i=1}^n$  and assume they are realizations of  $(Z_s)_{s \in \mathcal{S}}$ . Assume that the matrix  $C$  such as  $[C]_{i,j} = c(\|s_i - s_j\|)$  has an inverse. Consider the “Kriging” estimator  $\mu_{\text{KM}}$  of  $\mu$  as the BLUE (Best Linear Unbiased Estimator)

$$\mu_{\text{KM}} = \sum_{i=1}^n w_i Z(s_i) = w^\top Z,$$

for some unknown  $\{w_i\}$  that we need to learn.

- (1) Find sufficient conditions on  $w = (w_1, \dots, w_n)$  so that the Kriging estimator  $\mu_{\text{KM}}$  to be unbiased.
- (2) Assume  $C$  is invertable. Compute the MSE of  $\mu_{\text{KM}}$  as a function of  $w = (w_1, \dots, w_n)$  and  $C$
- (3) Derive the Kriging estimator  $\mu_{\text{KM}}$  of  $\mu$  as a function of  $C$
- (4) Derive the Kriging standard error as  $\sigma_{\text{KM}} = \sqrt{E(\mu_{\text{KM}} - \mu)^2}$  as a function of  $C$

**Exercise 16. (★)** Let  $(Z_s)_{s \in \mathcal{S}}$  be a specified statistical model. Assume that process  $(Z_s)_{s \in \mathcal{S}}$  has known mean  $\mu(s) = E(Z(s))$  and known covariance function  $c(\cdot, \cdot)$ . Assume there is available a dataset  $\{(s_i, Z_i := Z(s_i))\}_{i=1}^n$ . Assume that the matrix  $C$  such as  $[C]_{i,j} = c(s_i, s_j)$  has an inverse. Consider the “Kriging” estimator  $\mu_{\text{SK}}$ . Consider the “Kriging” estimator  $Z_{\text{SK}}(s_0)$  of  $Z(s_0)$  at an

<sup>1</sup>that is, the gradient of the log-likelihood

unseen spatial location  $s_0$  as the BLUE (Best Linear Unbiased Estimator)

$$Z_{\text{SK}}(s_0) = w_{n+1} + \sum_{i=1}^n w_i Z(s_i) = w_{n+1} + w^\top Z,$$

for some unknown  $\{w_i\}$  that we need to learn, and  $Z = (Z_1, \dots, Z_n)^\top$ . Let  $w = (w_1, \dots, w_n)^\top$ .

- (1) Find sufficient conditions on  $w = (w_1, \dots, w_n)^\top$  so that the Kriging estimator  $Z_{\text{SK}}(s_0)$  to be unbiased.
- (2) Derive the MSE of  $Z_{\text{SK}}(s_0)$  as

$$\text{E}(Z_{\text{SK}}(s_0) - Z(s_0))^2 = w^\top C w + c(s_0, s_0) - 2w^\top C_0$$

where  $C_0$  is a vector such as  $[C_0]_i = c(s_0, s_i)$ .

- (3) Derive the Kriging estimator of  $Z(s_0)$  as

$$Z_{\text{SK}}(s_0) = \mu(s_0) + C_0^\top C^{-1} [Z - \mu(s_{1:n})]$$

where  $\mu(s_{1:n})$  is a vector such as  $[\mu(s_{1:n})]_i = \mu(s_i)$ .

- (4) Compute the Kriging standard error  $\sigma_{\text{SK}} = \sqrt{\text{E}(Z_{\text{SK}}(s_0) - Z(s_0))^2}$ .

**Exercise 17.** (★) Assume a spatial model

$$(1) \quad Z(s) = \mu + \delta(s), \quad s \in \mathcal{S}$$

with unknown mean  $\mu \in \mathbb{R}$ . Assume a set of  $n$  observed realizations  $Z_i := Z(s_i)$  of (1) at sites  $s_i$  for  $i = 1, \dots, n$ . Assume that  $Z(s)$  is a weak stationary stochastic process with known covariogram  $c(\cdot)$ . Derive the formula for the Ordinary Kriging predictor  $Z_0 := Z(s_0)$  at spatial location  $s_0$  and its kriging variance as function of the covariogram  $c(h)$  and not the semi-variogram.

**Exercise 18.** (★) Let  $(Z_s)_{s \in \mathcal{S}}$  be a specified statistical model. Assume that  $(Z_s)_{s \in \mathcal{S}}$  is an intrinsic stationary process with unknown constant mean  $\mu(s) = \text{E}(Z(s))$  and known semi-variogram  $\gamma(\cdot)$ . Assume there is available a dataset  $\{(s_i, Z_i := Z(s_i))\}_{i=1}^n$ . Consider the “Kriging” estimator  $Z_{\text{OK}}(s_0)$  of  $Z(s_0)$  at any unseen spatial location  $s_0$  as the BLUE (Best Linear Unbiased Estimator)

$$Z_{\text{OK}}(s_0) = w_{n+1} + \sum_{i=1}^n w_i Z(s_i) = w_{n+1} + w^\top Z$$

for some unknown  $\{w_i\}$  that we need to learn, and  $Z = (Z_1, \dots, Z_n)^\top$ . Let  $w = (w_1, \dots, w_n)^\top$ .

- (1) Find sufficient conditions on  $w = (w_1, \dots, w_n)$  so that the Kriging estimator  $Z_{\text{OK}}(s_0)$  to be unbiased.
- (2) Derive the MSE of  $Z_{\text{OK}}(s_0)$  as

$$\text{E}(Z_{\text{OK}}(s_0) - Z(s_0))^2 = -w^\top \Gamma w + 2w^\top \gamma_0$$

where  $\gamma_0 = (\gamma(s_0 - s_1), \dots, \gamma(s_0 - s_n))^\top$  and  $\Gamma$  with  $[\Gamma]_{i,j} = \gamma(s_i - s_j)$

(3) Assume  $\Gamma$  is invertible matrix. Derive the Kriging estimator of  $Z(s_0)$  as

$$Z_{\text{OK}}(s_0) = \mathbf{\Gamma}^{-1} \left( \boldsymbol{\gamma}_0 + \frac{1 - \mathbf{1}^\top \mathbf{\Gamma}^{-1} \boldsymbol{\gamma}_0}{\mathbf{1}^\top \mathbf{\Gamma}^{-1} \mathbf{1}} \mathbf{1} \right) Z$$

(4) Derive the Kriging standard error of  $Z_{\text{OK}}(s_0)$  as

$$\sigma_{\text{SK}} = \sqrt{\boldsymbol{\gamma}_0 \mathbf{\Gamma}^{-1} \boldsymbol{\gamma}_0 - \frac{(1 - \mathbf{1}^\top \mathbf{\Gamma}^{-1} \boldsymbol{\gamma}_0)^2}{\mathbf{1}^\top \mathbf{\Gamma}^{-1} \mathbf{1}}}$$

---
