Exercise 1. Let $(Z_s)_{s\in\mathcal{S}}$ be a specified statistical model. Assume that $(Z_s)_{s\in\mathcal{S}}$ is weakly stationary with unknown constant mean $\mu = \mathrm{E}(Z(s))$ and known covariogram $c(\cdot)$. Assume there is available a dataset $\{(s_i, Z_i := Z(s_i))\}_{i=1}^n$ and assume they are realizations of $(Z_s)_{s\in\mathcal{S}}$. Assume that the matrix C such as $[C]_{i,j} = c(\|s_i - s_j\|)$ has an inverse. Consider the "Kriging" estimator μ_{KM} of μ as the BLUE (Best Linear Unbiased Estimator)

$$\mu_{\mathrm{KM}} = \sum_{i=1}^{n} w_i Z\left(s_i\right) = w^{\top} Z,$$

for some unknown $\{w_i\}$ that we need to learn.

- (1) Find sufficient conditions on $w = (w_1, ..., w_n)$ so that the Kriging estimator μ_{KM} to be unbiased.
- (2) Assume C is invertable. Compute the MSE of μ_{KM} as a function of $w = (w_1, ..., w_n)$ and C
- (3) Derive the Kriging estimator $\mu_{\rm KM}$ of μ as a function of C
- (4) Derive the Kriging standard error as $\sigma_{\rm KM} = \sqrt{\mathrm{E} \left(\mu_{\rm KM} \mu\right)^2}$ as a function of C

Solution 2. The method is called Kriging the Mean, and hence we denote it as KM.

(1) It is

$$\mu_{\mathrm{KM}} = \sum_{i=1}^{n} w_i Z\left(s_i\right) = w^{\top} Z,$$

where $\{w_i\}$ is a set of unknown weights to be learned.

We assume that assume zero systematic error (unbiasness), hence

$$E(\mu_{KM} - \mu) = E\left(\sum_{i=1}^{n} w_i Z(s_i) - \mu\right) = \sum_{i=1}^{n} w_i E(Z(s_i)) - \mu$$

which is satisfied given the assumption

$$\sum_{i=1}^{n} w_i = 1 \iff 1^{\top} w = 1 \quad (ASSUMPTION)$$

(2) It is

$$E(\mu_{KM} - \mu)^{2} = E(\mu_{KM}^{2} + \mu^{2} - 2\mu_{KM}\mu) = \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i}w_{j}E(Z(s_{i})Z(s_{j})) - \sum_{i=1}^{n} w_{i}\sum_{j=1}^{n} w_{j}\mu$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i}w_{j}(c(s_{i} - s_{j}) - \mu) = \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i}w_{j}c(s_{i} - s_{j}) = w^{T}Cw$$

(3) To learn the unknown weights $\{w_i\}$ we need to solve

$$w^{\text{KM}} = \underset{w}{\operatorname{arg\,minE}} (\mu_{\text{KM}} - \mu)^2$$
, subject to $\sum_{i=1}^{n} w_i = 1$

The Lagrange function is

$$\mathfrak{L}(w,\lambda) = \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} c(s_{i} - s_{j}) - 2\lambda \left(\sum_{i=1}^{n} w_{i} - 1\right)$$
$$= w^{\top} C w - 2\lambda \left(1^{\top} w - 1\right)$$

The Kriging to mean equations are $0 = \nabla_{w,\lambda} \mathfrak{L}(w,\lambda)$ producing

$$\begin{cases} 0 = 2 \sum_{j=1}^{n} w_j^{\text{KM}} c(s_i - s_j) - 2\lambda & \forall i = 1, ..., n \\ 1 = \sum_{i=1}^{n} w_i^{\text{KM}} \end{cases}$$

$$\begin{cases} 2Cw^{\text{KM}} - 2\lambda 1 = 0\\ 1^{\top}w^{\text{KM}} = 1 \end{cases}$$

Given that C^{-1} exists, I multiply by $1^{\top}C^{-1}$ and I get

$$21^{\mathsf{T}}C^{-1}Cw - 21^{\mathsf{T}}C^{-1}\lambda 1 = 0$$

SO

$$\lambda = \frac{1}{1^{\top} C^{-1} 1}$$

I substitute and I get

$$w^{\text{KM}} = \frac{C^{-1}1}{1^{\top}C^{-1}1}$$

So

$$\mu_{\mathrm{KM}} = \left(\frac{C^{-1}1}{1^{\top}C^{-1}1}\right)^{\top} Z$$

(4) It is

$$\sigma_{\text{KM}} = \sqrt{\mathbf{E} (\mu_{\text{KM}} - \mu)^2} = \sqrt{\left(\frac{C^{-1}1}{1^{\top}C^{-1}1}\right)^{\top} C \frac{C^{-1}1}{1^{\top}C^{-1}1}} = \frac{1}{\sqrt{1^{\top}C^{-1}1}}$$

Exercise 3. Let $(Z_s)_{s\in\mathcal{S}}$ be a specified statistical model. Assume that $(Z_s)_{s\in\mathcal{S}}$ is an intrinsic stationary process with unknown constant mean $\mu(s) = \mathbb{E}(Z(s))$ and known semi-variogram $\gamma(\cdot)$. Assume there is available a dataset $\{(s_i, Z_i := Z(s_i))\}_{i=1}^n$. Consider the "Kriging" estimator $Z_{OK}(s_0)$ of $Z(s_0)$ at any unseen spatial location s_0 as the BLUE (Best Linear Unbiased Estimator)

$$Z_{\text{OK}}(s_0) = w_{n+1} + \sum_{i=1}^{n} w_i Z(s_i) = w_{n+1} + w^{\top} Z$$

for some unknown $\{w_i\}$ that we need to learn, and $Z = (Z_1, ..., Z_n)^{\top}$. Let $w = (w_1, ..., w_n)^{\top}$.

- (1) Find sufficient conditions on $w = (w_1, ..., w_n)$ so that the Kriging estimator $Z_{OK}(s_0)$ to be unbiased.
- (2) Derive the MSE of $Z_{OK}(s_0)$ as

$$E (Z_{OK}(s_0) - Z(s_0))^2 = -w^{\mathsf{T}} \mathbf{\Gamma} w + 2w^{\mathsf{T}} \boldsymbol{\gamma}_0$$

where $\boldsymbol{\gamma}_{0} = \left(\gamma\left(s_{0}-s_{i}\right),...,\gamma\left(s_{0}-s_{n}\right)\right)^{\top}$ and Γ with $\left[\boldsymbol{\Gamma}\right]_{i,j} = \gamma\left(s_{i}-s_{j}\right)$

(3) Assume Γ is invertable matrix. Derive the Kriging estimator of $Z(s_0)$ as

$$Z_{\mathrm{OK}}\left(s_{0}
ight) = \mathbf{\Gamma}^{-1}\left(\boldsymbol{\gamma}_{0} + \frac{1 - \mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\boldsymbol{\gamma}_{0}}{\mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\mathbf{1}}\mathbf{1}\right)Z$$

(4) Derive the Kriging standard error of $Z_{OK}(s_0)$ as

$$\sigma_{
m SK} = \sqrt{oldsymbol{\gamma}_0 oldsymbol{\Gamma}^{-1} oldsymbol{\gamma}_0 - rac{ig(1 - 1^ op oldsymbol{\Gamma}^{-1} oldsymbol{\gamma}_0ig)^2}{1^ op oldsymbol{\Gamma}^{-1} 1}}$$

Solution. The method is called Ordinary Kriging, and hence we denote it as OK.

(1) It is

$$Z_{\text{OK}}(s_0) = w_{n+1} + \sum_{i=1}^{n} w_i Z(s_i) = w_{n+1} + w^{\top} Z,$$

where $\{w_i\}$ is a set of unknown weights to be learned.

$$E(Z_{OK}(s_0)) = w_{n+1} + \sum_{i=1}^{n} w_i E(Z(s_i)) \Leftrightarrow \mu = w_{n+1} + \mu \sum_{i=1}^{n} w_i$$

Unbiasness is satisfied given the assumption $w_{n+1} = 0$, and

$$\sum_{i=1}^{n} w_i = 1 \iff 1^{\top} w = 1 \quad (ASSUMPTION)$$

(2) The MSE of $Z_{OK}(s_0)$ is

$$MSE(Z_{OK}(s_{0})) = E(Z_{OK}(s_{0}) - Z(s_{0}))^{2} = E\left(\sum_{i=1}^{n} w_{i}Z(s_{i}) - \sum_{i=1}^{n} w_{i}Z(s_{0})\right)^{2}$$

$$= E\left(\sum_{i=1}^{n} w_{i}(Z(s_{i}) - Z(s_{0}))\right)^{2}$$

$$= -E\left(\frac{1}{2}\sum_{i=1}^{n}\sum_{j=1}^{n} w_{i}w_{j}(Z(s_{i}) - Z(s_{j}))^{2} - 2\sum_{i=1}^{n}\frac{1}{2}w_{i}(Z(s_{i}) - Z(s_{0}))^{2}\right)$$

$$= -\sum_{i=1}^{n} w_{i}\sum_{j=1}^{n} w_{j}\frac{1}{2}E(Z(s_{i}) - Z(s_{j})^{2}) + 2\sum_{i=1}^{n} w_{i}\frac{1}{2}E(Z(s_{i}) - Z(s_{0})^{2})$$

$$= -\sum_{i=1}^{n} w_{i}\sum_{j=1}^{n} w_{j}\gamma(s_{i} - s_{j}) + 2\sum_{i=1}^{n} w_{i}\gamma(s_{i} - s_{0})$$

$$= -w^{T}\Gamma w + 2w^{T}\gamma_{0}$$

where $w = (w_1, ..., w_n)^{\top}$, $\boldsymbol{\gamma}_0 = (\gamma(s_0 - s_i), ..., \gamma(s_0 - s_n))^{\top}$, and $[\boldsymbol{\Gamma}]_{i,j} = \gamma(s_i - s_j)$.

(3) The Lagrange multiplier function to minimize the MSE under the assumption is

$$\mathfrak{L}(w,\lambda) = -\sum_{i=1}^{n} w_i w_j \gamma \left(s_i - s_j\right) + 2\sum_{i=1}^{n} w_i \gamma \left(s_0 - s_i\right) - \lambda \left(\sum_{i=1}^{n} w_i - 1\right)$$
$$= -w^{\top} \Gamma w + 2w^{\top} \gamma_0 - \lambda \left(1^{\top} w - 1\right)$$

The OK system of equations is $0 = \nabla_{(\{w_i\},\lambda)} L(w,\lambda)|_{(w,\lambda)}$ producing

$$\begin{cases} 0 = -2\sum_{j=1}^{n} w_{j}^{\text{OK}} \gamma\left(s_{i} - s_{j}\right) + 2\gamma\left(s_{0} - s_{i}\right) - \lambda, & i = 1, ..., n \\ 1 = \sum_{i=1}^{n} w_{i}^{\text{OK}} \end{cases} \iff \begin{cases} 0 = -2\Gamma w_{\text{OK}} + 2\gamma_{0} - \lambda_{\text{OK}} 1 \\ 1 = 1^{\top} w_{\text{OK}} \end{cases}$$

Assuming Γ is invertable and multiplying by $1^{\top}\Gamma^{-1}$ it is

$$0 = -2\mathbf{\Gamma}w_{\mathrm{OK}} + 2\boldsymbol{\gamma}_{0} - \lambda_{\mathrm{OK}}\mathbf{1} \Longleftrightarrow$$

$$0 = -2\mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\mathbf{\Gamma}w_{\mathrm{OK}} + 2\mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\boldsymbol{\gamma}_{0} - \mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\lambda\mathbf{1} \Longleftrightarrow$$

$$\lambda_{\mathrm{OK}} = 2\frac{\mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\boldsymbol{\gamma}_{0} - \mathbf{1}}{\mathbf{1}^{\top}\mathbf{\Gamma}^{-1}\mathbf{1}}$$

By substitution I get

$$w_{ ext{OK}} = \mathbf{\Gamma}^{-1} \left(oldsymbol{\gamma}_0 + rac{1 - \mathbf{1}^ op \mathbf{\Gamma}^{-1} oldsymbol{\gamma}_0}{\mathbf{1}^ op \mathbf{\Gamma}^{-1} \mathbf{1}} \mathbf{1}
ight)$$

Hence

$$Z_{\mathrm{OK}}\left(s_{0}\right) = w_{\mathrm{OK}}Z = \mathbf{\Gamma}^{-1}\left(\boldsymbol{\gamma}_{0} + \frac{1 - \mathbf{1}^{\mathsf{T}}\mathbf{\Gamma}^{-1}\boldsymbol{\gamma}_{0}}{\mathbf{1}^{\mathsf{T}}\mathbf{\Gamma}^{-1}\mathbf{1}}\mathbf{1}\right)Z$$

(4) It is

$$\sigma_{\text{OK}}(s_0) = \sqrt{\text{MSE}(Z_{\text{OK}}(s_0))}$$

$$= \sqrt{-w^{\top} \Gamma w + w^{\top} \gamma_0}$$

$$= \sqrt{\gamma_0 \Gamma^{-1} \gamma_0 - \frac{\left(1 - 1^{\top} \Gamma^{-1} \gamma_0\right)^2}{1^{\top} \Gamma^{-1} 1}}$$

Note regarding the calculations in MSE:

$$\begin{split} \left(\sum_{i=1}^{n} w_{i} \left(Z\left(s_{i}\right) - Z\left(s_{0}\right)\right)\right)^{2} &= \left(\sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)\right)^{2} \\ &= \sum_{i=1}^{n} w_{i}^{2} \left(Z_{i} - Z_{0}\right)^{2} + 2 \sum_{1 \leq i < j < n} w_{i} \left(Z_{i} - Z_{0}\right) w_{j} \left(Z_{j} - Z_{0}\right) \\ &= \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} \left(Z_{i} - Z_{0}\right) \left(Z_{j} - Z_{0}\right) \\ &= 2\frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} \left(Z_{i} - Z_{0}\right) \left(Z_{j} - Z_{0}\right) \\ &- \frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} - \frac{1}{2} \sum_{j=1}^{n} w_{j} \left(Z_{j} - Z_{0}\right)^{2} \\ &+ 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \\ &= -\frac{1}{2} \left(\sum_{i=1}^{n} w_{i} \sum_{j=1}^{n} w_{j} \left[\left(Z_{i} - Z_{0}\right)^{2} + \left(Z_{j} - Z_{0}\right)^{2} - 2w_{i}w_{j} \left(Z_{i} - Z_{0}\right) \left(Z_{j} - Z_{0}\right)\right]\right) \\ &+ 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \\ &= -\frac{1}{2} \left(\sum_{i=1}^{n} w_{i} \sum_{j=1}^{n} w_{j} \left[\left(Z_{i} - Z_{0}\right) - \left(Z_{j} - Z_{0}\right)\right]^{2}\right) + 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \\ &= -\frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} \left(Z_{i} - Z_{j}\right)^{2} + 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \\ &= -\frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} \left(Z_{i} - Z_{j}\right)^{2} + 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \\ &= -\frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} w_{i} w_{j} \left(Z_{i} - Z_{j}\right)^{2} + 2\frac{1}{2} \sum_{i=1}^{n} w_{i} \left(Z_{i} - Z_{0}\right)^{2} \end{split}$$
